Dataset Statistics

Table 1: Statistics of the datasets used in our experiments. $|E|$, $|R|$, and $|A|$ denote the numbers of entities, relations, and attributes, respectively. Rel. and Attr. triples denote relation and attribute triples. Gold links denote reference alignments.

Dataset	Subset	KG	$\|E\|$	$\|R\|$	$\|A\|$	Rel. triples	Attr. triples	Gold links

† DBP1M originally contains only relation triples. In our experiments, one entity-name literal triple is added per entity, using a separate label predicate for each KG. The attribute counts above include these added triples.

Table 2: Additional statistics of the OAEI knowledge graph alignment datasets. Instances, classes, and properties are reported separately. Gold alignments are reference correspondences for each category.

Dataset	KG	Graph elements			Gold alignments		
		Instances	Classes	Properties	Instances	Classes	Properties
Mem–ST	Memory Alpha	45,828	181	325	1,725	13	41
	Star Trek Expanded Universe	13,426	283	202			
Star–SWT	Star Wars Wiki	145,033	269	700	1,358	15	56
	The Old Republic Wiki	4,180	101	368			

Table 1 and Table 2 summarize the statistics of the datasets used in our experiments. Following AttrGNN [5], we use the DBP15K version enriched with attribute values from the DBpedia dump (2016-10). Since DBP1M originally contains no literal attributes, we add one entity-name literal per entity, using a separate label predicate for each KG, to enable FLORA+ to run and ensure comparability with methods using entity name information. We convert the resulting graphs to Turtle (`.ttl`) format for direct loading by FLORA+. We also construct a DBpedia–YAGO dataset from DBpedia (2022-12-01) [6] and YAGO 4.5 [7], with reference alignments derived from shared Wikidata identifiers. We only remove non-English literals, cross-graph identity links, and media and web metadata.
